This report is funded by the U.S. Bureau of Reclamation, East Bay Municipal Utilities District, and the California Department of Water Resources contracts with the Pacific States Marine Fisheries Commission (PSMFC). The work necessary to produce this report was a cooperative effort between the California Department of Fish and Wildlife and the PSMFC. For a copy of this report, please contact Brett Kormos at brett.kormos@wildlife.ca.gov.

INTRODUCTION

Each year, approximately 32 million fall-run Chinook salmon (*Oncorhynchus tshawytscha*) are produced at five hatcheries in California's Central Valley (CV): Coleman National Fish Hatchery (CFH), Feather River Hatchery (FRH), Nimbus Fish Hatchery (NIM), Mokelumne River Hatchery (MOK), and Merced River Hatchery (MER). Production from these hatcheries contributes to CV escapement and sport harvest while also supporting ocean fisheries in California and Oregon. Since 2007, a constant fractional marking (CFM) program has ensured that at least 25% of all CV hatchery production fish are tagged with a microscopic (≤ 1 mm) coded-wire tag (CWT). Each CWT contains a binary or alpha-numeric code that identifies a specific release group of salmon (e.g., agency, species, run, brood year, hatchery or wild stock, release size, release date(s), release location(s), number tagged and untagged). Each salmon containing a CWT is also externally marked with a clipped adipose fin (ad-clip) to allow for easy visual identification.

This is the eighth annual report on the recovery of CFM CWTs in the CV and ocean fisheries. In 2017, approximately 32,400 CWTs were recovered and successfully read from ad-clipped Chinook salmon sampled in CV fall-, winter-, spring-, and late-fall-run natural area spawning surveys, at CV hatcheries, in the CV angler sport harvest, and in ocean salmon commercial and sport fisheries south of Cape Falcon (i.e., California and Oregon).

This report will focus primarily on the results of analyses addressing the following questions:

- What are the proportions of hatchery- and natural-origin salmon in spawner returns to CV hatcheries and natural areas, in inland harvest, and in ocean fisheries? Of the hatchery component, what proportions originated from in-basin versus out-of-basin CWT release strategies?
- What are the relative recovery and stray rates for hatchery-origin salmon released in-basin versus salmon released into the waters of the Sacramento-San Joaquin River Delta, San Francisco-San Pablo bays, or coastal areas? How do recovery and stray rates differ between salmon acclimated in net pens and their siblings released directly into the water? Are these metrics affected by transporting salmon smolts down their natal waterways by vessel and exposing them to river water prior to release in the bay?
- What are the relative recovery and contribution rates of hatchery-origin salmon, by run and release type, to ocean and inland harvests?

Please see earlier annual CFM reports (Kormos et al. 2012, Palmer and Kormos 2013, 2015) for more in-depth information and discussion regarding the CFM program, CWT marking and recovery programs in California, and the methods and analyses used in this report. Additional information on salmon escapement monitoring can be found in the Central Valley Chinook Salmon Escapement Monitoring Plan (Bergman et al. 2012) and other CV salmon population reports (e.g., Killam and Mache 2018, PSMFC 2018).

DATA AND METHODS

Inland Escapement and River Sport Harvest Monitoring

During 2017, monitoring of salmon escapement occurred at all five salmon hatcheries and on major rivers and tributaries throughout the CV. In addition, an angler creel survey was conducted on sport fisheries in the Sacramento, Feather, American, and Mokelumne river basins. It should be noted that the late-fall-run escapement in the upper Sacramento River and at CFH in this report is considered the 2018 return year, however the escapement monitoring period began in late 2017.

Sampling and estimation methods (e.g., carcass surveys, snorkel surveys, weir counts) continue to vary among natural spawner surveys throughout the CV (Table 1); however, most 2017 surveys on major rivers and in the hatcheries adequately sampled (sample rate $\geq 20\%$) for ad-clipped fish. The sampling rate was generally lower for smaller creeks where biodata was collected over a few days or in limited areas.

Of the approximately 147,600 Chinook salmon that returned to the CV basins analyzed in this report, 81,800 salmon were sampled, 27,300 ad-clipped salmon were observed, and 25,200 heads were collected by various CV projects. Monitoring agencies and projects included the California Department of Fish and Wildlife (CDFW), California Department of Water Resources (DWR), East Bay Municipal Utility District (EBMUD), Pacific States Marine Fisheries Commission, U.S. Bureau of Reclamation, U.S. Fish and Wildlife Service (FWS), and the Yuba Accord River Management Team (YARMT). Most heads were processed by CDFW at their Santa Rosa and Sacramento CWT labs, except for 5,500 heads collected at CFH, which were processed by FWS staff, and several hundred heads collected and processed by CDFW projects in Red Bluff and La Grange.

All estimates of CV escapement or harvest and the number of salmon sampled in this report were provided by individual monitoring projects or hatcheries.

Ocean Harvest Monitoring

In 2017, California sport and commercial ocean salmon fisheries (Table 2) were highly constrained compared to most years primarily due to a sharp decrease in the abundance of Klamath River fall-run Chinook salmon. The poor status of this stock resulted in complete fishery closures off northern California and southern Oregon, and extremely limited seasons southward through the San Francisco Bay Area. Salmon fisheries in Monterey Bay and south were also highly constrained mostly due to protections that were enacted for Sacramento River winter-run Chinook salmon. Of the approximately 104,500 salmon harvested in California ocean fisheries during 2017, CDFW field staff sampled over 27,700 salmon and collected over 7,200 heads that were processed by the Santa Rosa CWT lab. Almost 700 heads collected in Oregon ocean sport and commercial fisheries during 2017 are also included in these analyses since Sacramento River fall-run Chinook salmon is the primary stock harvested in fisheries south of Cape Falcon, Oregon (PFMC 2016).

Each year, CDFW validates and uploads all CWT recoveries in California, along with their respective catch-sample data, to the Regional Mark Processing Center (RMPC), which is the central repository for west coast CWT recoveries. All 2017 inland and ocean CWT recoveries are publicly available on the RMPC website at www.rmpec.org.

CWT Data Analysis

A master release database of CWT codes recovered in 2017 was created to determine species, brood year, run, stock origin (hatchery or natural), release site, release date(s), number of salmon CWT tagged, total number of salmon released, and any other pertinent release information (e.g., trucked, net pen acclimation, disease issues). Since almost all CV salmon recovered are between the ages of two and five, all CWT release data for Chinook salmon brood years 2012 through 2015 were downloaded from the RMPC. Approximately 132 million CV salmon were released for these brood years, of which 47 million were marked and tagged utilizing 370 unique CWT codes. Although a few thousand natural-origin salmon are often trapped, marked, and tagged annually, salmon produced by hatcheries make up 99% or greater of all CWT releases. In 2017, there were 257 individual CWT codes recovered in the CV, primarily from age-2, age-3, and age-4 salmon. The CWT master file was updated with any additional information obtained for special CV salmon releases (e.g., barge study) and the production factor calculated for each CWT code. The production factor, F_{prod} , is the ratio of the total number of salmon released to the total number of salmon marked containing a CWT. Thus, it is the total number of salmon (i.e., tagged and untagged) represented by each CWT recovery. F_{prod} was calculated for each CWT code and is defined as,

$$F_{\text{prod}} = (\text{Ad.CWT} + \text{Ad.noCWT} + \text{noAd.CWT} + \text{noAd.noCWT}) / \text{Ad.CWT} ,$$

where Ad.CWT is the number of salmon released with ad-clips and CWTs, Ad.noCWT is the number of salmon released with ad-clips but without CWTs (i.e., shed tags prior to release or CWT not correctly inserted), noAd.CWT is the number of salmon released without ad-clips but with CWTs, and noAd.noCWT is the number of salmon released without ad-clips and without CWTs. F_{prod} allows expansion to total hatchery production from observed recoveries of CV CWTs. It should be noted that certain release types (e.g., barge study) experienced significant pre-release mortality due to factors related to transport and predation at the release site that went unreported in the RMPC. In some cases, where numbers of mortalities are unavailable in the release information, the resulting calculation for F_{prod} may bias results.

For this analysis, each CV Chinook salmon CWT release was classified into a “release type” based on the following criteria: hatchery or natural stock, run, release location, and holding strategy. All CV CWT codes were assigned by brood year into one of seventeen fall-run release types, two spring-run release types, one winter-run release type, or two late-fall-run release types:

Sacramento River Basin Fall-run Chinook salmon release types:

CFHFh Coleman National Fish Hatchery **F**all-run **h**atchery releases (in-basin)
CFHFb Coleman National Fish Hatchery **F**all-run bay/delta **n**et pen releases

FRHF Feather River Hatchery **F**all-run in-basin releases
 FRHF_n Feather River Hatchery **F**all-run bay/delta **n**et pen releases
 FRHF_{nc} Feather River Hatchery **F**all-run **c**oastal **n**et pen releases (Pillar Point)
 FRHF_{tib} Feather River Hatchery **F**all-run **T**iburon net pen releases
 FRHF_b Feather River Hatchery **F**all-run **b**arge study releases
 FRHF_k Feather River Hatchery **F**all-run **K**naggs Ranch experimental releases
 NIMF Nimbus Fish Hatchery **F**all-run in-basin releases
 NIMF_n Nimbus Fish Hatchery **F**all-run bay/delta **n**et pen releases

San Joaquin River Basin Fall-run Chinook salmon release types:

MOKF Mokelumne River Hatchery **F**all-run in-basin releases
 MOKF_n Mokelumne River Hatchery **F**all-run bay/delta **n**et pen releases
 MOKF_{nc} Mokelumne River Hatchery **F**all-run **c**oastal **n**et pen releases (various sites)
 MOKF_b Mokelumne River Hatchery **F**all-run **b**arge study releases
 MOKF_x Mokelumne River Hatchery **F**all-run **e**xperimental releases (raised Merced Hatchery)
 MERF_n Merced River Hatchery **F**all-run bay/delta **n**et pen releases
 MERF_t Merced River Hatchery **F**all-run **t**rucked releases (no net pen acclimation)

Sacramento River Winter-run Chinook salmon release type:

SacW Sacramento River **W**inter-run supplementation natural production releases (in-basin)

Central Valley Spring-run Chinook salmon release types:

FRHS Feather River Hatchery **S**pring-run in-basin releases
 FRHS_n Feather River Hatchery **S**pring-run bay/delta **n**et pen releases

Central Valley Late-fall-run Chinook salmon release types:

CFHL_h Coleman National Fish Hatchery **L**ate-fall-run **h**atchery releases (in-basin)
 CFHL_e Coleman National Fish Hatchery **L**ate-fall-run **e**mergency releases (Balls Ferry)

Note that not all release types occur every year and that release sites sometimes vary within a given release type (Table 3; Fig. 1). There were also a few problem CWT releases where fish were released utilizing more than one strategy (e.g., only half of brood year 2014 coastal MOKF_{nc} was released into Moss Landing net pens while the other half was released into bay/delta net pens). Thus, we urge caution when analyzing or comparing CWT recovery data from certain release types.

To estimate the total escapement or harvest associated with each CWT recovery, each tag recovery was expanded by its respective F_{prod} and sample expansion factor, F_{samp} , which is defined as,

$$F_{samp} = 1 / (f_e \times f_a \times f_d),$$

where f_e is the fraction of the total salmon escapement sampled and visually examined for an ad-clip, f_a is the fraction of heads from ad-clipped salmon collected and

processed, and f_d is the fraction of observed CWTs that were successfully decoded (Tables 4 and 5).

Salmon sampled in CV carcass surveys are generally classified as ‘fresh’ or ‘non-fresh’ based on criteria such as condition of the eyes (clear vs. opaque) or gills (pink vs. grey). Often the ad-clipped (marked) status of a non-fresh (i.e., decayed) salmon cannot be determined due to the deteriorating condition of the carcass. While condition criteria are somewhat ambiguous and classification may vary among surveys, the ad-clip rate of fresh salmon sampled in 2017 was generally higher or similar to the rate observed in non-fresh fish (Appendix 1). Fresh carcass heads also contained CWTs at a slightly higher rate than heads collected from non-fresh fish. Furthermore, the sample sizes between fresh and non-fresh fish are usually very different with the number of non-fresh salmon sampled generally much greater than fresh salmon in surveys that collected both conditions.

Mohr and Satterthwaite (2013) demonstrated how the sampling differences noted above could negatively bias the estimates of hatchery contribution. However, they cautioned that using only CWT data from fresh fish could eliminate the occurrence of rare CWT codes in analyses due to the small sample sizes common with fresh carcasses in these surveys. As in previous CFM reports, the following equation developed by Mohr and Satterthwaite (2013) was used to calculate F_{samp} for carcass surveys collecting fish condition data, thus reducing the potential to underestimate hatchery contribution while still incorporating CWT codes from both fresh and non-fresh fish:

$$F_{samp} = (N \times p_{adc|fresh} \times p_{cwt|fresh,adc}) / (n_{valid\ cwt}),$$

where N = estimated total escapement, $p_{adc|fresh}$ = proportion of fresh salmon sampled that were ad-clipped, $p_{cwt|fresh,adc}$ = proportion of ad-clipped fresh salmon that contained a CWT, and $n_{valid\ cwt}$ = total number of valid CWTs collected from fresh and decayed salmon.

To help differentiate between raw CWT recoveries, CWT recoveries expanded for production, CWTs expanded for sampling, and CWTs expanded for production and sampling, the following nomenclature is used:

- CWT = Raw count CWT recoveries
- CWT_{prod} = CWT recoveries expanded by their respective production factor, F_{prod}
- CWT_{samp} = CWT recoveries expanded by their respective sample expansion factor, F_{samp}
- CWT_{total} = CWT recoveries expanded by both F_{prod} and F_{samp}

Determining hatchery- and natural-origin proportions in CV escapement and harvest

To determine the contribution of hatchery- and natural-origin salmon, all CWT_{total} were summed to estimate the total number of hatchery salmon in each survey. The

contribution of natural-origin salmon for each survey was then determined by subtracting the total number of hatchery salmon from the total escapement estimate, as follows:

$$\text{Estimate of natural-origin salmon} = \text{Total escapement estimate} - \sum_{i=1}^m CWT_{total,i} ,$$

where m = total number of hatchery-origin CWT release groups identified in an escapement survey or hatchery.

Determining recovery rates of various release types in CV escapement and ocean harvest

To determine the relative CV recovery rate, R_{cwt} , of each unique CWT release group (i.e., code), all recoveries were expanded by their location-specific F_{samp} , summed over all recovery locations, and then divided by the total number of salmon tagged and released with this CWT. Since expanded recoveries for several individual CWT groups were less than 0.001% of the total number released, recovery rates are reported in recoveries per 100,000 CWT salmon released, as follows:

$$R_{cwt} = \sum_{j=1}^l CWT_{samp,j} \text{ recoveries} / (\text{CWT release group size} / 100,000),$$

where j ($=1,2,3,\dots,l$) denotes recovery location.

Data from all CWT release groups belonging to the same brood year and release type (e.g., coastal net pen) were combined and an overall release type-specific CV recovery rate, R_{type} , was calculated as:

$$R_{type} = \sum_{j=1}^l \sum_{k=1}^n CWT_{samp,j,k} / \left(\sum_{k=1}^n \text{release group size of } CWT_k / 100,000 \right),$$

where k ($= 1,2,3,\dots,n$) denotes release group.

Determining stray proportions of various release groups in CV escapement

To be consistent with previous reports (Kormos et al. 2012, Palmer-Zwahlen and Kormos 2013, 2015, 2020, Palmer-Zwahlen et al. 2018, 2019a, 2019b), basin-of-origin is defined as the drainage within which a particular hatchery is located. Given the five hatcheries under consideration in this report, the CV is divided into five hatchery basins (hatchery code in parentheses): (1) upper Sacramento River, including Battle Creek (CFH), (2) Feather River, including the Yuba River (FRH), (3) American River (NIM), (4) Mokelumne River (MOK), and (5) Merced River (MER). Hatchery-origin salmon not returning to their basin-of-origin or to streams and rivers not included in any hatchery basin (e.g., Butte Creek, Stanislaus River, Tuolumne River) are considered strays. Appendices 2 and 3 present alternative recovery and stray rates for CFH and FRH CWT

releases based on the assumption that recoveries in the upper Sacramento River and Yuba River, respectively, are strays.

To determine the CV stray proportion, S_{cwt} , for each CWT code, the sum of all CWT_{smp} recoveries collected outside the basin of origin was divided by total CV CWT_{smp} recoveries for that release group, as follows:

$$S_{cwt} = \sum_{p=1}^o CWT_{smp,p} \text{ (out-of-basin locations)} / \sum_{p=1}^q CWT_{smp,p} \text{ (all CV locations)},$$

where p denotes recovery location, o denotes the number of out-of-basin recovery locations, and q denotes the total number of recovery locations.

Data from all CWT releases belonging to the same brood year and release type were combined and release type-specific CV stray proportion, S_{type} , was calculated as:

$$S_{type} = \sum_{p=1}^o \sum_{k=1}^n CWT_{smp,p,k} \text{ (out-of-basin)} / \sum_{p=1}^q \sum_{k=1}^n CWT_{smp,p,k} \text{ (all CV locations)}.$$

RESULTS

General overview of 2017 CV inland recoveries and California ocean harvest

All of the 24,700 valid CWTs recovered in the CV during 2017 were from CV Chinook salmon releases. Most CWTs were brood year 2013 through 2015 releases (Table 6). A small number of CWT recoveries ($n=9$) were removed from CFM analyses because they were age-1 and/or part of experimental releases by the San Joaquin River Restoration Program (SJRRP). About 94% of all CWT_{total} were fall-run, followed by late-fall-run (4%) and spring-run (1%) salmon releases. Less than 1% of CWT_{total} were winter-run, all of which were collected in the upper Sacramento River winter- and late-fall-run carcass surveys, and the Keswick Dam Fish Trap (KES), where natural winter-run fish are collected for broodstock purposes at Livingston Stone National Fish Hatchery. The majority of fall-run CWT_{total} recovered in the CV were age-3 (53%), age-2 (43%), and age-4 (4%) fish.

Most of the 7,000 valid CWT recoveries (tagged natural-origin and experimental SJRRP fish removed; $n=8$) in the 2017 California ocean harvest were CV salmon releases belonging to brood years 2013 through 2015 (Table 7). Approximately 97% of all CWT_{total} in the ocean harvest were CV fall-run, followed by CV late-fall-run (1%), CV spring-run (0.4%), and CV winter-run (0.4%) salmon. The remaining 1% of California ocean CWT recoveries originated primarily from the Klamath-Trinity Basin and Smith River in northern California, the Rogue and Elk rivers in Oregon, and the Columbia River Basin. Most of the hatchery-origin fish in the California ocean harvest were age-3 (56%) and age-2 (41%) fish.

Over one-third of the 600 valid CWT recoveries (age-6 removed; n=6) in the 2017 Oregon ocean harvest were CV salmon releases (Table 8). Approximately 38% of all CWT_{total} in the ocean harvest were CV fall-run salmon; no other CV run types were recovered. Non-CV stocks made up 62% of the CWT_{total} harvest with most originating from the Columbia River Basin, coastal streams in Oregon, and the Klamath-Trinity Basin. Most of the hatchery fish in the Oregon ocean harvest were age-3 (76%) and age-4 (18%) fish.

1. Proportion of Hatchery- and Natural-origin Salmon in CV Escapement

During 2017, approximately 37,500 fall-run Chinook salmon returned to spawn in the CV natural areas included in these analyses (Table 9, Fig. 2). There were an additional 3,900 fall-run salmon that spawned in natural areas of tributaries that are excluded here because sample rates and resultant CWT recoveries were too low to produce reliable results. The proportion of hatchery-origin salmon in those areas sampled varied throughout the CV. The lowest hatchery proportion occurred in Butte Creek (0%), while the highest proportion (98%) occurred in the Stanislaus River. The second highest hatchery proportion occurred in the Feather River (92%). The total CV fall-run hatchery proportion for all natural areas that were adequately sampled during 2017 was 81%.

The only upper Sacramento Basin tributary that is included in these analyses is Battle Creek fall-run, however the hatchery proportion was estimated using a surrogate since a carcass survey or CWT recovery program has not occurred in this waterway since 2005. The hatchery contribution and CWT release type composition in the Battle Creek fall-run escapement is assumed equivalent to the hatchery fall-run return sampled at CFH (K. Niemela, FWS, pers. comm.).

The hatchery proportion of the 58,200 fall-run salmon returning to the five CV hatcheries and KES ranged from 49% to 97% (Table 9, Fig. 3). The fall-run hatchery proportion for all CV hatcheries combined was 94%. The spring-run return to FRH was almost entirely hatchery-origin fish (98%), while the late-fall-run return to CFH was 100% hatchery-origin salmon.

To help differentiate the hatchery composition, all CV release types from the same stock, run, and hatchery use the same shade of color in the pie chart figures: Blue = Sacramento River Basin fall-run releases, Green = San Joaquin Basin fall-run releases, Purple = Central Valley (FRH) spring-run releases, Yellow = Sacramento River winter-run releases, and Orange = Central Valley (CFH) late-fall-run releases (Fig. 4). Additionally, select patterns are used to designate different release types. All bay/delta net pen releases contain black dots, while coastal net pen releases are designated with a crisscross pattern. Experimental barge study and Knaggs Ranch rice field study releases are designated with straight and wavy horizontal stripes, respectively. In-basin releases do not have any pattern.

Upper Sacramento River Basin

At CFH, sampling of the fall-run return began in early October and continued through late November 2017. All ad-clipped salmon were sampled during the entire run. CFH began late-fall-run sampling five weeks after fall-run sampling ceased and continued through mid-March 2018. For the interim five weeks, and even the last month of fall-run spawning, there was overlap between runs and FWS staff parsed them out based on CWT recoveries. As a result, the final escapement was 6,396 fall-run and 3,906 late-fall-run salmon. Due to low counts of fall-run salmon at CFH during early October and to promote genetic integrity, an additional 111 fall-run salmon (93 unmarked) were collected at KES in the mainstem Sacramento River and transported to CFH as supplemental broodstock. In addition, 18 late-fall-run salmon (16 unmarked) were collected at KES and transported to CFH for spawning to promote genetic integrity. Only one additional late-fall-run salmon was trapped at CFH after spawning operations ended in mid-March 2018, and none were observed via the video weir. Thus, the CFH late-fall-run fish trap data, which is usually reported separately, has been merged with the CFH late-fall-run hatchery return data for this report.

Fall-run returns to CFH and fall spawners in Battle Creek were predominantly hatchery-origin salmon, and late-fall-run returns to CFH were entirely hatchery-origin. Natural-origin spawners comprised most of the fall and late-fall returns to KES and the upper Sacramento River mainstem. Winter-run spawners in the upper Sacramento River were primarily hatchery-origin fish (Figs. 5, 6). The proportion of hatchery-origin fish (prevalent release type[s] shown in parentheses) at each of the following locations was:

- Fall-run returns CFH: 87% (CFHFh)
- Late-fall-run returns CFH: 100% (CFHLh)
- Fall-run supplemental spawners KES: 49% (CFHFh)
- Late-fall-run supplemental spawners KES: 11% (CFHLh)
- Winter-run spawners upper Sacramento River: 82% (SacW)
- Fall-run spawners upper Sacramento River: 21% (CFHF_n, CFHFh)
- Late-fall-run spawners upper Sacramento River: 12% (CFHLh)
- Fall-run spawners Battle Creek: 86% (CFHFh)

Butte Creek and Feather River Basin

Spring- and fall-run returns to FRH and spawners in the Feather and Yuba rivers were predominantly hatchery-origin, while both spring- and fall-run spawners in Butte Creek were entirely natural-origin (Figs. 7, 8). Unlike most prior reports, the Yuba River escapement below and above Daguerre Point Dam (DPD) was combined in 2017 because the estimate below DPD was only 20 fish (PSMFC 2018). The proportion of hatchery-origin fish (prevalent release type[s] shown in parentheses) at each of the following locations was:

- Spring-run spawners Butte Creek: 0%
- Fall-run spawners Butte Creek: 0%

- Spring-run returns FRH: 98% (FRHS)
- Fall-run returns FRH: 97% (FRHFn)
- Fall/spring-run spawners Feather River: 92% (FRHFn)
- Fall/spring-run spawners Yuba River: 87% (CFHFn)

Appendix 4 provides the F_{samp} calculations for the Yuba River, which was based on ad-clips observed via video above DPD and visual counts below DPD, combined with CWTs recovered during carcass surveys.

American River Basin

Fall-run returns to NIM and spawners in the American River were predominantly of hatchery-origin (Fig. 9), while “washbacks” collected on the NIM weir were mostly natural-origin salmon. In 2017, NIM opened three weeks early to collect stray CFH fall-run spawners, which were expected to stray into the American River in high numbers due to the age-3 year class being entirely released into bay/delta net pens. The proportion of hatchery-origin fish (prevalent release type[s] shown in parentheses) at each of the following locations was:

- Fall-run returns NIM: 90% (NIMFn, CFHFn)
- Fall-run spawners American River: 77% (CFHFn, NIMFn)
- Fall-run returns NIM weir: 40% (CFHFn)

Mokelumne River Basin

The 2017 fall-run return to the Mokelumne River Basin was the largest on record (Del Real and Hunter 2018, PFMC 2020). Returns to MOK and spawners in the Mokelumne River were predominantly hatchery-origin salmon (Fig. 10). The proportion of hatchery-origin fish (prevalent release type[s] shown in parentheses) at each of the following locations was:

- Fall-run returns MOK: 94% (MOKFn)
- Fall-run spawners Mokelumne River: 86% (MOKFn, NIMFn)

Appendix 5 provides the F_{samp} calculations for Mokelumne River natural area spawners, which was based on a combination of ad-clips observed via video weir, ad-clips returning to MOK, and CWTs recovered during carcass surveys. There were weekly high pulse flow events throughout much of the spawning period in 2017 (Del Real and Hunter 2018), which likely hampered carcass recovery efforts.

Merced River and other San Joaquin Basin tributaries

Fall-run returns to MER and spawners in the Merced, Stanislaus, and Tuolumne rivers were predominantly hatchery-origin salmon (Fig. 11). The proportion of hatchery-origin fish (prevalent release type[s] shown in parentheses) at each of the following locations was:

- Fall-run returns MER: 96% (MOKFn)
- Fall-run spawners Merced River: 87% (MOKFn, CFHFfn)
- Fall-run spawners Stanislaus River: 98% (MOKFn)
- Fall-run spawners Tuolumne River: 87% (MOKFn)

2. Contribution of CV Release Types to Total Salmon Escapement

In 2017, 88% of the 102,800 salmon that returned to the CV hatcheries and natural areas included in these analyses were hatchery-origin fish (Tables 9, 10). Of all hatchery release types, fall-run bay/delta net pen releases contributed the most to total CV escapement: FRHFfn (31%), MOKFn (16%), NIMFn (11%), and CFHFfn (10%). Bay/delta CFHFfn, MOKFn, and NIMFn had the highest numbers of strays, while bay/delta CFHFfn and MERFn had the highest rates of straying. About a third of all recoveries occurred outside their basin-of-origin and ranged from 0% to 98%, depending on release type:

Hatchery-origin contribution by R_{type} to total CV salmon escapement

| R _{type} | Run | CWT _{total} | % total | # Stray | % stray |
|-------------------|-----------|----------------------|---------|---------|---------|
| CFHFfn | Fall | 5,923 | 6% | 4 | <1% |
| CFHFfn | Fall | 9,884 | 10% | 9,726 | 98% |
| FRHF | Fall | 44 | <1% | 0 | 0% |
| FRHFfn | Fall | 31,908 | 31% | 2,717 | 9% |
| FRHFfnc | Fall | 2,884 | 3% | 399 | 14% |
| FRHFfb | Fall | 65 | <1% | 3 | 5% |
| FRHFfk | Fall | 21 | <1% | 0 | 0% |
| NIMF | Fall | 373 | <1% | 4 | 1% |
| NIMFn | Fall | 10,874 | 11% | 4,669 | 43% |
| MOKF | Fall | 246 | <1% | 73 | 30% |
| MOKFn | Fall | 16,262 | 16% | 6,938 | 43% |
| MOKFnc | Fall | 2,843 | 3% | 915 | 32% |

3. Hatchery Proportion and Contribution of CV Release Types to CV Sport Fishery

In 2017, 81% of the 41,600 salmon harvested in the CV river sport fishery were hatchery-origin fish (Table 9; Figs. 12, 13). The proportion of hatchery-origin fish (prevalent release type[s] shown in parentheses) in each of the following fisheries was:

- Upper Sacramento River fall-run harvest: 76% (CFHFh)
- Lower Sacramento River fall-run harvest: 66% (FRHF_n, NIMF_n, CFHF_n, MOKF_n)
- Feather River fall-run harvest: 88% (FRHF_n)
- American River fall-run harvest: 86% (CFHF_n, NIMF_n, FRHF_n, MOKF_n)
- Mokelumne River fall-run harvest: 82% (MOKF_n, NIMF_n)
- Upper Sacramento River late-fall-run harvest: 72% (CFHLh)

Of all hatchery release types, FRHF_n contributed the most (33%) to the total CV sport harvest, followed by CFHF_n (14%) and NIMF_n (11%). In-basin releases were primarily harvested in their basin-of-origin or the lower Sacramento River (which all CV stocks must traverse before reaching their basin-of-origin), with the only exceptions being a small number of MOKF and CFHLh harvested out-of-basin. Conversely, net pen releases were harvested out-of-basin at considerably higher rates, and it is worth noting that very few of them were harvested in the upper Sacramento River including zero CFHF_n which originated from there (Tables 9, 10).

Hatchery-origin contribution by R_{type} to total CV river harvest

| R _{type} | Run | CWT _{total} | % harvest |
|--------------------|-----------|----------------------|-----------|
| CFHFh | Fall | 2,333 | 6% |
| CFHF _n | Fall | 6,012 | 14% |
| FRHF | Fall | 93 | <1% |
| FRHF _n | Fall | 13,534 | 33% |

| CFHLh | Late-fall | 885 | 2% |
| | Total | 33,498 | 81% |

4a. Relative Recovery and Stray Rates of CV Release Types in Total Escapement

Release strategies vary among hatcheries from year to year. This variability has often been in response to annual fluctuations in the abundance of certain stocks or differing policies among agencies with respect to best release practices. The 2013 through 2015 brood year releases were more consistent than release types analyzed in earlier CFM reports (Kormos et. al. 2012, Palmer-Zwahlen and Kormos 2013, 2015) and only a few “mixed strategy” releases were identified (Table 3).

Table 11 summarizes total CWT_{samp} recoveries and the escapement recovery rate, R_{type} , (in-basin and stray) for all release types collected in the CV escapement and ocean fisheries during 2017. The CWTs collected in the CV river sport fishery are not included since it is not possible to ascertain the location where these fish would have eventually spawned. Recovery rates are standardized utilizing total CWT_{samp} recoveries per 100,000 tagged salmon released. Release types with less than 15,000 total fish released with CWTs are not reported below since just a few recoveries could result in relatively large recovery and stray rate estimates.

Figures 14 and 15 provide a graphical representation of R_{type} for Sacramento River fall-run Chinook salmon and other CV stocks, respectively, and include the total number of salmon released with CWTs for each release type. Fall-run salmon that were acclimated in bay/delta and coastal net pens generally had higher CV recovery rates than their respective in-basin releases, but net pen releases also had higher stray rates than their in-basin counterparts in most cases.

Age-2 CV Escapement Recovery and Stray Rates

| R_{type} | Brood year | Run | # Recoveries per 100K Released | # Strays per 100K Released | % stray |
|-------------------|------------|-----------|-----------------------------------|-------------------------------|---------|

4b. Relative Recovery Rate of CV Release Types in the Ocean Harvest

The total recovery rate of CV hatchery releases in all California and Oregon ocean salmon sport and commercial fisheries varied by age and release type (Table 11). A higher percentage of age-2 CV hatchery salmon were recovered in the ocean sport fishery (Fig. 16) due to the smaller size limits in effect during 2017 compared to those for the commercial fishery (Table 2).

Age-2 Ocean Harvest Recovery Rate; Percent taken in Sport Harvest

| R _{type} | Brood year | Run | # Recoveries per 100K Released | % sport |
|--------------------|------------|-----------|-----------------------------------|---------|

5. Hatchery Proportion and Contribution of CV Release Types to Ocean Salmon Fisheries

More than two-thirds of the 126,400 Chinook salmon harvested in all California and Oregon ocean salmon fisheries were hatchery-origin fish (Fig. 17). The most prevalent CV release types recovered in both states were fall-run net pen releases.

Hatchery-origin contribution by R_{type} to CA and OR ocean harvest

| R _{type} | Run | CWT _{total} | % harvest |
|-------------------|----------|----------------------|-----------|
| CFHFh | Fall | 2,341 | 2% |
| CFHFn | Fall | 13,259 | 10% |

| Other CV | Non-fall | 994 | 1% |
| NonCV | | 7,620 | 6% |
| | Total | 86,799 | 69% |

California ocean sport fishery

California anglers harvested approximately 62,200 Chinook salmon in the ocean sport fishery during 2017. The total contribution of hatchery-origin salmon to the California ocean sport fishery was 75%, ranging from 62% to 81% of the total harvest among major port area (Fig. 18). Most of the harvest occurred in San Francisco (86%), followed by Monterey (11%) and Fort Bragg (3%) port areas (Table 12). The Eureka-Crescent City port area was closed to salmon fishing in 2017.

Of all hatchery release types, FRHF_n contributed the most (24%) to the total California ocean sport harvest, followed by MOKF_n (18%). Non-CV releases contributed less than 1% to the total harvest (Table 13).

Hatchery-origin contribution by R_{type} to CA ocean sport harvest

| R _{type} | Run | CWT _{total} | % harvest |
|--------------------|-----------|----------------------|-----------|
| CFHF _h | Fall | 2,127 | 3% |
| CFHF _n | Fall | 4,766 | 8% |
| FRHF | Fall | 62 | 0% |

| | Total | 46,913 | 75% |

California ocean commercial fishery

California trollers harvested over 42,300 Chinook salmon in the ocean commercial fishery during 2017. The total contribution of hatchery-origin salmon to the California ocean commercial fishery was 69%, ranging from 55% to 73% of the total harvest depending on major port area (Fig. 19). Most of the harvest occurred in San Francisco (66%), followed by Monterey (29%) and Fort Bragg (5%) port areas (Table 14). The Eureka-Crescent City port area was closed to salmon fishing in 2017.

Of all hatchery release types, FRHF_n contributed the most (20%) to the total California commercial harvest, followed by CFHF_n (18%), MOKF_n (11%), and NIMF_n (11%). Non-CV releases contributed about 2% to the total harvest (Table 15).

Hatchery-origin contribution by R_{type} to CA ocean commercial harvest

6. Relative Recovery and Stray Rates of Fall-run Experimental and Net Pen Release Types

In 2017, CWTs from many fall-run experimental and net pen release types were recovered in the CV escapement, river sport fishery, and ocean harvest, and this section will focus on those from brood years 2013 through 2015 (ages 2-4).

Experimental releases include barge studies that utilized approximately 900,000 fall-run salmon from two different hatcheries (FRH and MOK), and rice field studies at Knaggs Ranch that utilized almost 200,000 fall-run from FRH. Additionally, low spawner returns to MER during fall 2014 required the use of supplemental fall-run eggs from MOK to ensure minimum hatchery production numbers were met. Almost 600,000 smolts were produced from these transported eggs and designated experimental MOKF_x. Recoveries of these age-3 CWTs in either the Mokelumne or Merced basins were considered in-basin recoveries for this report.

Net pen releases can be categorized into either bay/delta or coastal releases. Bay/delta net pen releases include those that are released in the western Delta (CFH, MOK, and MER), and those that are released where the Carquinez Strait meets San Pablo Bay (FRH and NIM). Coastal net pen releases include those coordinated by the Coastside

Fishing Club in Pillar Point and those coordinated by the Monterey Bay Trout and Salmon Project (MBTSP) in Santa Cruz and Moss Landing. It should be noted that in 2015, MBTSP moved their net pen operations to Moss Landing due to operational issues with the Santa Cruz Port District. After receiving and releasing their first group of brood year 2014 fall-run salmon from MOK (120,000 salmon), it was determined that MBTSP did not have the proper permits to release salmon in the Moss Landing area so the remaining 120,000 fish with the same CWT code were instead released into bay/delta net pens.

The experimental and net pen releases recovered in 2017 are differentiated into the following release types:

- CFHF_n Coleman National Fish Hatchery **F**all-run bay/delta **n**et pens
- FRHF_{bb} Feather River Hatchery **F**all-run **b**arge study: trucked and released in SF **B**ay
- FRHF_{bg} Feather River Hatchery **F**all-run **b**arge study: barged to SF Bay and released
- FRHF_{br} Feather River Hatchery **F**all-run **b**arge study: released in-river (Sac R)
- FRHF_{kc} Feather River Hatchery **F**all-run rice field study: Elkhorn Boat Ramp (**K**naggs control)
- FRHF_{kr} Feather River Hatchery **F**all-run rice field study: **K**naggs **R**anch (Yolo Bypass)
- FRHF_n Feather River Hatchery **F**all-run bay/delta **n**et pens
- FRHF_{np} Feather River Hatchery **F**all-run coastal **n**et pens – **P**illar Point
- NIMF_n Nimbus Fish Hatchery **F**all-run bay/delta **n**et pens
- MOKF_{bb} Mokelumne River Hatchery **F**all-run **b**arge study: trucked and released in SF **B**ay
- MOKF_{bg} Mokelumne River Hatchery **F**all-run **b**arge study: barged to SF Bay and released
- MOKF_{br} Mokelumne River Hatchery **F**all-run **b**arge study: released in-river (Mok R)
- MOKF_n Mokelumne River Hatchery **F**all-run bay/delta **n**et pens
- MOKF_{np} Mokelumne River Hatchery **F**all-run coastal **n**et pens – **P**illar Point
- MOKF_{ns} Mokelumne River Hatchery **F**all-run coastal **n**et pens – **S**anta Cruz/Moss Landing
- MOKF_x Mokelumne River Hatchery **F**all-run **e**xperimental: raised at Merced Hatchery
- MERF_n Merced River Hatchery **F**all-run bay/delta **n**et pens

Central Valley Escapement

The CV escapement recovery rate and percent stray for all fall-run experimental and net pen releases are included below to allow direct comparison among these release types (Table 16, Fig. 20).

Age-2 CV Escapement Recovery and Stray Rates

| R _{type} | Brood year | Run | # Recoveries per 100K Released | # Strays per 100K Released | % stray |

Ocean Fishery Harvest

The total recovery rate of fall-run experimental and net pen releases in all California and Oregon ocean salmon sport and commercial fisheries varied by age and release type (Table 16, Fig. 21). A higher percentage of age-2 releases were recovered in the ocean sport fishery, again due to smaller size limits in effect during 2017 compared to the commercial fishery (Table 2).

Age-2 Ocean Harvest Recovery Rate; Percent taken in Sport Harvest

| R _{type} | Brood year | Run | # Recoveries per 100K Released | % sport |

2017 CFM ANALYSES KEY POINTS

- During 2012 through 2016, California experienced a severe drought, with the 2012 through 2014 period being the driest in the state’s history. All brood years covered in this report were affected as juvenile outmigrants during this drought as they were subjected to high temperatures and low flows during their freshwater residency. Dewatering of eggs and/or pre-emergent fry loss was reported by numerous CV projects during this period, especially when minimum flow requirements were reduced in late fall. Pre-spawn mortality rates were also above normal in many rivers and streams. Due to these factors, natural-origin juvenile production was low for the broods that contributed most to escapement and fisheries in 2017 (PFMC 2019).

- To increase the survival of hatchery smolts to the ocean during the peak of the drought, state hatchery managers in the CV transported and released all of their fall-run salmon production for brood years 2013 and 2014 into bay/delta net pens. Federal hatchery managers at CFH, who historically released all of their fall-run production directly into Battle Creek in the upper Sacramento Basin where CFH is located, also transported and released two-thirds of brood year 2013 and all of their brood year 2014 fall-run production into bay/delta net pens. In 2017 there was some concern over the potential for high stray rates for hatchery-origin fall-run salmon, since these broods that were almost entirely planted offsite were returning to the CV at ages 3 and 4. Based on previously high stray rates (>90%) for offsite CFH releases, coupled with poor freshwater rearing and emigration conditions for these broods during the drought, there was special concern over the potential for low fall-run spawner returns in the upper Sacramento Basin. That potential was realized when a record-low number of fall-run returned to the upper Sacramento Basin, at only 10% of the long-term average (Killam and Mache 2018, PFMC 2020). This had a substantial effect on the river sport fishery as it redistributed a large amount of angling effort to the American and Feather rivers, resulting in a record-high river exploitation rate on Sacramento River Basin fall-run Chinook salmon in 2017 (PFMC 2019).
- The cumulative effects of the drought, straying outside of the basin, and possibly abnormal ocean conditions resulted in a 2017 escapement for Sacramento River Basin fall-run Chinook salmon that was about one-third of the federal conservation objective and the second-lowest on record. It was the third consecutive year of poor spawner returns for this stock, and due to its continued decline and the severity of the escapement shortfall it met the federal criteria for overfished status after the 2017 escapement (PFMC 2019). At the time of this report's publication in 2020, this stock was still overfished.
- A large majority (88%) of the total 2017 CV salmon escapement (all run-types) were hatchery-origin fish. This was the highest hatchery contribution since the CFM program was fully implemented, suggesting low natural-origin production for at least a portion of the broods that contributed to the 2017 escapement. Between 2010 and 2016, the hatchery contribution to the total CV escapement averaged 75% and ranged between 66% and 83%. FRH fall-run bay/delta releases composed almost one-third of the total 2017 CV escapement, and bay/delta fall-run releases from MOK, NIM, and CFH were the next highest contributors.
- Almost all (98%) expanded recoveries of CFH fall-run bay/delta releases occurred out-of-basin. MER fall-run offsite releases also strayed at a very high rate (73%), followed by NIM and MOK fall-run bay/delta releases which both strayed at 43%.
- This was the highest stray rate for NIM fall-run bay/delta releases since the CFM program was fully implemented, and the third consecutive year of higher than average stray rates. Between 2011 and 2014, stray rates for this release type ranged between 2% and 5%, but then increased sharply in 2015 to 25%, followed by 31% in 2016 and 43% in 2017. During those three years of increased straying, a large majority of those

strays returned to the Mokelumne River. It is possible that inter-annual variations in CV water operations, such as pulse flow events and management of the Delta Cross Channel, are influencing the degree to which NIM bay/delta releases stray outside of the American River. Fall pulse flows in the Mokelumne River were higher than average during 2016 and 2017 (Del Real and Hunter 2018, Del Real and Rible 2017).

- Salmon escapement into CV hatcheries was predominately hatchery-origin fish. At all CV hatcheries except MER, the majority of their return was composed of their respective releases. But a large proportion of the return to MER (82%) were fish from other hatcheries, particularly MOK fall-run bay/delta releases. The out-of-basin hatchery return at NIM was also quite high (47%), and almost half of those strays were CFH fall-run bay/delta releases. CDFW staff were prepared for this high influx of CFH-origin spawners due to the release strategies employed for the 2013 and 2014 broods, and NIM opened three weeks early to collect these strays due to the differential run timing between the CFH and NIM fall-run stocks.
- Most natural spawning areas had very high proportions of hatchery-origin fish, with the only exceptions being Butte Creek, washbacks on the NIM weir, and the upper Sacramento River fall- and late-fall-run escapements. Most of the hatchery-origin component in the Feather and Mokelumne rivers and Battle Creek consisted of release types from their respective hatcheries, whereas hatchery-origin spawners in natural areas of the American and Merced rivers were predominantly stray CFH and MOK fall-run bay/delta releases.
- Fall-run escapement in the upper Sacramento River mainstem was predominantly natural-origin salmon but was also the lowest escapement on record. The hatchery contribution in 2017 (21%) was the lowest since the CFM program was fully implemented. Between 2010 and 2016, the hatchery contribution in the upper Sacramento River mainstem averaged 48% and ranged between 27% and 68%. The low hatchery contribution during 2017 was likely due to extensive straying of CFH bay/delta releases into other basins further downstream. CFH bay/delta and in-basin releases each composed one-third of the hatchery-origin portion of the mainstem escapement. Due to the record-low number of spawners in the upper Sacramento Basin in 2017, relatively few fish were sampled in upper basin tributaries and only one CWT was recovered, so those tributaries were excluded from these analyses.
- Fall-run escapement to the natural spawning areas of the Feather River was predominantly hatchery-origin salmon. FRH bay/delta releases composed a large majority of the run, distantly followed by FRH coastal (Pillar Point) releases.
- Fall-run escapement in the Yuba River was predominantly hatchery-origin salmon with stray CFH bay/delta releases composing a majority of the run.
- Fall-run escapement to the natural spawning areas of the American River was predominantly hatchery-origin salmon, a third of which were stray CFH bay/delta releases, followed by NIM bay/delta releases. Conversely, washbacks on the NIM weir were predominantly natural-origin salmon, however fresh and non-fresh washbacks

were not differentiated which may underestimate the hatchery contribution (Mohr and Satterthwaite 2013).

- Fall-run escapement to the natural spawning areas of the Mokelumne River was predominately hatchery-origin salmon, primarily MOK bay/delta releases and stray NIM bay/delta releases.
- The natural area fall-run escapements in all sampled tributaries of the San Joaquin Basin south of the Mokelumne River (Stanislaus, Tuolumne, and Merced rivers) were predominantly hatchery-origin salmon with the majority being stray MOK bay/delta releases. The second-highest contributor was stray CFH bay/delta releases, particularly in the Merced River where it composed over a quarter of the run.
- For age-2 fall-run salmon, MOK coastal (Pillar Point), MOK barge study (excluding the in-river control group), MER bay/delta, and MER non-acclimated trucked releases had the highest CV escapement recovery rates for their cohort, however they also had high stray rates. Fall-run releases from MER, both those that were acclimated in net pens and those that were not, had the highest stray rates with approximately three-fourths and two-thirds of the age-2 return, respectively, spawning in non-natal basins, distantly followed by NIM bay/delta, MOK bay/delta, MOK barge study (excluding the in-river control group), and MOK coastal (Pillar Point) releases.
- For age-3 fall-run salmon, FRH coastal (Pillar Point), FRH bay/delta, and NIM bay/delta releases had the highest CV escapement recovery rates for their cohort. CFH bay/delta, MER non-acclimated trucked, and MER bay/delta releases from this cohort had extremely high stray rates approaching 100%.
- For age-4 fall-run salmon, FRH coastal (Pillar Point) had the highest CV escapement recovery rate for its cohort, distantly followed by FRH barge study, FRH bay/delta, CFH bay/delta, and NIM bay/delta releases. CFH bay/delta releases from this cohort returned entirely to non-natal basins (i.e., stray rate of 100%), as did the only age-4 MER non-acclimated trucked recovery. MOK bay/delta releases from this brood also strayed at a very high rate.
- Most (81%) of the total CV river sport harvest was of hatchery origin and predominantly composed of bay/delta fall-run releases from FRH, CFH, NIM, and MOK. A large majority (81%) of the river harvest recoveries of CFH fall-run bay/delta releases occurred in the American River sport fishery, which was the only fishery sector where in-basin hatchery fish did not compose a majority of the harvest.
- Approximately three-fourths and two-thirds of the California ocean sport and commercial harvest, respectively, was composed of hatchery-origin fish. Bay/delta fall-run releases from FRH, MOK, and CFH contributed heavily to the total harvest in both fisheries. Non-CV hatchery production contributed very little to California ocean harvest, however in 2017 ocean salmon fisheries off northern California were either closed or extremely limited, and that is the section of California coast where non-CV stocks typically have higher contributions to harvest.

- CV hatchery production contributed less to Oregon ocean harvest than is usually observed, although in 2017 salmon fishing was prohibited in federal waters off southern Oregon, and that is the section of Oregon coast where contacts with CV stocks are expected to be highest.
- Coastal fall-run releases from FRH and MOK had the highest ocean recovery rates among all release types and broods. Generally speaking, their ocean recovery rates were several times greater than the rates for bay/delta fall-run releases of the same cohort.
- Among the coastal net pen release locations, Pillar Point releases (MOK and FRH) had both the highest CV and ocean recovery rates. While recovery rates of Santa Cruz/Moss Landing releases (MOK) were not necessarily low, they were much lower than Pillar Point releases for cohorts that had both release types (i.e., 2013 and 2014 broods). However, as mentioned above, half of the brood year 2014 (age-3) Moss Landing net pen release group from MOK was actually released into bay/delta net pens after encountering permitting issues with Moss Landing fish releases. Most CV recoveries of coastal releases occurred in-basin.
- CV recoveries of late-fall- and spring-run releases were dominated by age-2 salmon. Since all late-fall-run hatchery production is released in-basin and all spring-run hatchery production has been released in-basin since brood year 2014 (age-3), the high preponderance of age-2 salmon in the CV spawner return suggests low outmigrant survival for these run types prior to brood year 2015, likely due to in-river drought conditions.
- Among age-2 barge study releases, salmon transported from MOK to San Francisco Bay for release both via barge and truck had much higher CV and ocean recovery rates than the in-river control group, but also had higher stray rates.
- Due to low river flows caused by drought conditions, there was no barge study conducted for brood year 2014 (age-3).
- Among age-4 barge study releases, salmon released as part of the Feather River barge study had much higher CV recovery rates than those released as part of the Mokelumne River barge study, and both exhibited minimal straying. Salmon transported via barge from MOK and the in-river control group from FRH had the highest ocean recovery rates among both of the barge studies conducted for this brood. There were no ocean recoveries of salmon transported via truck from MOK. Additionally, there were no recoveries whatsoever (CV or ocean) of this cohort's in-river control group from MOK for the second consecutive year, suggesting low outmigrant survival for this release type and brood.
- This is the first report in the series that has recovery data for non-experimental FRH fall-run in-basin releases (age-2), allowing for recovery and stray rate comparisons between in-basin and out-of-basin FRH fall-run releases from the same brood. Initial results for the 2015 brood suggest substantially lower survival for in-basin releases as

their CV and ocean recovery rates were only 5 and 8 CWTs per 100,000 released, respectively, compared to recovery rates of 169 and 134 CWTs per 100,000 released, respectively, for bay/delta releases. While there were very few inland CWT recoveries of these in-basin releases (n=13), they were all recovered in the Feather River whereas bay/delta releases from the same brood strayed at 8%.

CONCLUSION

A primary goal of this report is to provide information that will be useful in California salmon management, including CV hatchery assessment. As with each of the previous seven CFM reports, the estimates of hatchery contribution and recovery rate by release type presented in this report should be viewed as a “single year snapshot” of salmon escapement and harvest in the CV and California ocean fisheries during 2017. It is highly probable that all the release types and broods in this report were affected by one of the most significant droughts in California history. Although no discussion section is included, as in earlier CFM reports covering the 2010, 2011, and 2012 escapement and harvest years, the authors plan to further analyze these data as these and additional tagged broods become complete. This report contains the data and analyses needed to determine the contribution of hatchery- and natural-origin salmon to hatchery and natural areas throughout the CV, evaluate hatchery release strategies and programs, improve California ocean and river salmon fisheries management, evaluate the effectiveness of habitat restoration, and determine if other goals of the CFM program are being met on an annual basis. This information, combined with other tools such as cohort reconstruction and harvest models, will allow resource managers to determine the total contribution of various release strategies to CV escapement and to ocean and inland fisheries by time and area.

The CFM program should be continued with the current design to provide comparable, consistent data needed for hatchery and harvest management. A need still exists to secure permanent and comprehensive inland and ocean funding for this marking, tagging, monitoring, and evaluation program. Such funding is essential to providing complete analyses of recovery and stray rates across release strategies, and will allow critical data to be available by February of each year to manage CV salmon stocks, hatchery production, and California ocean and river fisheries in real-time, similar to the Klamath Basin fall-run Chinook salmon management process.

ACKNOWLEDGEMENTS

We express sincere appreciation to the myriad of staff among many agencies that work tirelessly in the field to gather the necessary data and CWT recoveries that provide the basis for this report. They are too numerous to name individually, but without each of them, this valuable analysis would not be possible. We again thank the following agencies for providing 2017 CV escapement estimates and their respective salmon heads or CWT recoveries: CDFW, DWR, FWS, PSMFC, EBMUD, and YARMT. Special thanks are extended to staff at the following hatcheries for their cooperation in this monitoring effort: Coleman National Fish Hatchery, Feather River Hatchery, Nimbus Fish Hatchery, Mokelumne River Hatchery, Merced River Hatchery, and Livingston Stone National Fish Hatchery.

Special kudos are extended to both CDFW Santa Rosa and Sacramento CWT labs for processing almost 20,000 salmon heads and recovering, reading, and validating most of the CWTs used in this analysis. Personal thanks are extended to FWS staff Kevin Offill and Kevin Niemela for providing the catch-sample and CWT data collected at CFH and KES facilities, and to CDFW staff Steve Tsao, Bill Smith, Tracy McReynolds, Lea Koerber, Penny Crawshaw, Doug Killam, Clint Garman, Jeanine Phillips, and Jay Rowan for answering questions and providing additional information pertaining to their CV sectors.

Thanks to the following individuals for providing internal review and text edits for this report: CDFW staff Pete McHugh, Grace Ghrist, Audrey Dean, Robyn Bilski, Erica Meyers, Ryon Kurth, Jay Rowan, Tracy McReynolds, and Morgan Kilgour.

We, as always, want to acknowledge Stan Allen (PSMFC) and Alice Low (CDFW retired) for their efforts in developing the CFM program and facilitating its funding, staffing, tagging, and coordination needs. Funding for most of the sampling and CWT processing provided by BOR, CDFW, DWR, EBMUD, SFRA, and YARMT.

| Sampling Location | Estimation and Sampling Methods | Agency |
|--|---|--------|
| Hatchery Spawners | | |
| Coleman National Fish Hatchery (CFH) Fall and Late-Fall (2018) | Direct count. All fish examined and bio-sampled ^{a/} for fin-clips, tags, marks. Access upstream of the hatchery closed Aug 1 - Sep 30. Fall-run period: Oct 3 - Nov 21, Late-fall-run period: Dec 27 - Mar 14. All ad-clipped fish sampled. Fish returning to CFH from late Oct through late Dec parsed into run-type based on CWT code recoveries and total run-type proportions by date. All unmarked phenotypic late-fall-run fish released into Battle Creek above CFH beginning Nov 21. After spawning operations ceased, one additional ad-clipped late-fall-run fish was trapped and sampled; none were observed via video weir. Grilse cutoff: 700 mm fall, 600 mm late-fall. | FWS |
| Keswick Fish Trap (KES) Winter, Fall, and Late-Fall (2018) | Direct count. All fish examined and bio-sampled for fin-clips, tags, marks. During Mar-Jul, all unmarked fish electronically sampled for presence of CWT and genetically tested to ensure winter-run broodstock. To supplement CFH broodstock due to low hatchery returns, KES was also utilized to collect fall-run during Oct-Nov and late-fall-run during Dec-Jan. Grilse cutoff: 620 mm females, 710 mm males winter; 700 mm fall; 600 mm late-fall. | FWS |
| Feather River Hatchery (FRH) Spring and Fall | Direct count. All fish examined for fin-clips, tags, marks. Fish arriving at the hatchery Jun 5 - Jul 14 (n~ 762) were considered "spring-run" and marked with uniquely-numbered dart tags prior to release back into the Feather River. Only fish marked with dart tags returning to FRH in fall were spawned as spring-run. All remaining fish were considered fall-run. FRH fish ladder opened Sep 18 and spring spawning began Sep 22. All spring-run fish bio-sampled. From Sep 23 - 29, fall-run CWT fish were spawned, and eggs for all fish found to be spring-run were kept and used for spring-run sampling. All fish were bio-sampled. Fall spawning occurred on Sep 19 for the cold water program and began normally on Oct 9. Systematic random bio-sample ~20% of all fish for fall-run until Oct 31, when the rate was reduced to 10%. All ad-clipped fish were sampled and heads collected for CWT recovery. Grilse cutoff: 650 mm spring and fall. | CDFW |
| Nimbus Fish Hatchery (NIM) Fall | Direct count. NIM ladder open Oct 9 - Jan 2. All fish examined for fin-clips, tags, marks. Systematic random bio-sample of 20% of total fish. All ad-clipped fish sampled and heads collected for CWT recovery. Grilse cutoff: 685 mm. | CDFW |
| Mokelumne River Hatchery (MOK) Fall | Direct count. MOK open Oct 17 - Jan 18. All fish examined for fin-clips, tags, marks. Systematic random bio-sample 25% of total fish returning until Oct 24 when the rate was reduced to 10%. All ad-clipped fish sampled and heads collected for CWT recovery. Grilse cutoff: 640 mm females, 680 mm males. | CDFW |
| Merced River Hatchery (MER) Fall | Direct count. MER open Oct 19 - Dec 11. All fish examined for fin-clips, tags, marks. All ad-clipped fish were sampled and heads processed for CWT recovery. Grilse cutoff: 630 mm females, 740 mm males. | CDFW |

^{a/} Biological sampling ("bio-samples" or "bio-data") of live fish or carcasses may include observed tags or marks, sex, fork length, scales, carcass condition, spawning condition, and heads collected from ad-clipped fish for CWT recovery.

Table 1b. Estimation and sampling methods used for the 2017 CV Chinook natural escapement. (page 1 of 2)

| Sampling Location | Estimation and Sampling Methods | Agency |
|--|---|-----------|
| Natural Spawners | | |
| Upper Sacramento River Mainstem Winter, Fall, and Late-Fall (2018) | Population estimate for each run produced utilizing five-step process: 1) Superpopulation modification of the Cormack-Jolly-Seber mark-recapture estimate using all females within carcass survey area (Balls Ferry Bridge to Keswick Dam). 2) Total female escapement estimate in upper Sacramento River is derived using expansions for females spawning outside of the survey area (Princeton to Balls Ferry) through aerial redd surveys. 3) Adult male escapement estimated using adult sex ratio of live fish counts at CFH or Keswick Trap. 4) Grilse escapement estimated using survey ratio of fresh adult males to fresh grilse. 5) Addition of any fish removed for hatchery brood stock purposes. All fish in carcass survey examined for fin-clips, tags, marks, and condition (e.g., fresh, non-fresh, skeleton). Bio-data ^{al} collected from all fresh fish. Systematic random bio-sample may occur if carcass counts expected to be high. All ad-clipped fish (fresh and non-fresh), including "unknown" ad-clipped status, were sexed, measured and heads collected for CWT recovery. Grilse cutoff: 645 mm females, 720 mm males winter; 675 mm females, 765 mm males fall; 610 mm females, 620 mm males late-fall. | CDFW, FWS |
| Clear Creek Fall | Video Station count used to estimate population. Supplemental bio-sampling survey used to estimate biological characteristics of the population (age, sex, hatchery-origin, spawn success). All fish in carcass survey examined for fin-clips, tags, marks, and condition (e.g., fresh, non-fresh, skeleton). Bio-data collected from all fresh fish. All ad-clipped fish (fresh and non-fresh), including "unknown" ad-clipped status, were sampled and heads collected for CWT recovery. Grilse cutoff: 665 mm female, 745 mm male. | CDFW, FWS |
| Cow Creek Fall | Video weir count in lower creek used to determine total escapement. Kayak surveys conducted to collect bio-data from fresh fish. Opportunistic collection of CWTs, however only one unmarked carcass observed. Due to low sample size, bio-sampling data from Clear Creek used as a surrogate. | CDFW |
| Battle Creek Fall | Video weir count (Aug 23 - Dec 7) in lower creek used to determine total fall-run escapement. Natural fall-run escapement into Battle Creek calculated by subtracting CFH fall-run return from total run. Surrogate CWTs based on hatchery proportion and CWT composition of CFH fall-run return. Grilse cutoff: 700 mm. | CDFW |
| Cottonwood Creek Fall | Video weir count (Sep 20 - Dec 15) in lower creek used to determine total escapement. Kayak surveys conducted to collect bio-data from fresh fish, however no carcasses were observed. Due to low sample size, bio-sampling data from Clear Creek used as a surrogate. | CDFW |
| Mill Creek Fall | Video counts at Ward Dam in lower Mill Creek plus expanded redd count between Ward Dam and the Sacramento River confluence used to determine total escapement. Bio-sampling surveys conducted to collect bio-data from fresh fish, however only three unmarked carcasses observed. Due to low sample size, bio-sampling data from Clear Creek used as a surrogate. | CDFW |
| Deer Creek Fall | Video counts at Stanford Vina Ranch Irrigation Company (SVRIC) Dam plus expanded redd count between SVRIC Dam and the Sacramento River confluence used to determine total escapement. Kayak surveys conducted to collect bio-data from fresh fish, however no carcasses were observed. Due to low sample size, bio-sampling data from Clear Creek used as a surrogate. | CDFW |

Table 1b. Estimation and sampling methods used for the 2017 CV Chinook natural escapement. (page 2 of 2)

| Sampling Location | Estimation and Sampling Methods | Agency |
|-------------------------------|---|-------------|
| Natural Spawners cont. | | |
| Butte Creek Spring and Fall | Superpopulation modification of the Cormack-Jolly-Seber mark-recapture estimate for spring-run, however too few fall-run carcasses handled (n=9) to utilize this methodology, so fall-run estimate derived from Vaki Riverwatcher count and number of carcasses handled downstream. All fish examined for fin-clips, tags, marks. Systematic random bio-sample of all fish. No ad-clipped fish were observed in either survey. Grilse cutoff: 600 mm spring, 650 mm fall. | CDFW |
| Feather River Fall | Superpopulation modification of the Cormack-Jolly-Seber mark-recapture estimate. All fish examined for fin-clips, tags, marks. Systematic random bio-sample of fresh fish. All ad-clipped fresh fish sampled and heads collected for CWT recovery. Escapement estimate includes spring-run. Grilse cutoff: 650 mm. | DWR |
| Yuba River Fall | Above Daguerre Point Dam (DPD): Vaki Riverwatcher direct count of escapement and ad-clipped fish. Supplemental carcass survey to collect bio-data and heads from ad-clipped fish (fresh fish only). Below DPD: Mark-recapture estimate not used in 2017 due to low numbers of fresh carcasses (n=8) and recaptures (n=1), so estimate derived from number of carcasses observed. All fish examined for fin-clips, tags, marks, and condition. All ad-clipped fresh fish sampled and heads collected for CWT recovery. Escapement estimate includes spring-run. Grilse cutoff: 650 mm. | CDFW, YARMT |
| American River Fall | Superpopulation modification of the Cormack-Jolly-Seber mark-recapture estimate. All fish examined for fin-clips, tags, marks, and condition. Systematic random bio-sample of all fish. All ad-clipped fish sampled and heads collected for CWT recovery. Grilse cutoff: 650 mm females, 730 mm males. | CDFW |
| Nimbus Weir Fall | Direct count. Installed Sept 21 to force returning salmon into Nimbus Hatchery; salmon that migrated above prior to installation trapped between Nimbus Dam (located 1/4 mile upstream) and weir. All dead fish that washed back down river ("washbacks") onto weir examined for fin-clips, tags, marks. All ad-clipped fish sampled and heads collected for CWT recovery. Grilse cutoff: 685 mm. | CDFW |
| Mokelumne River Fall | Video count at Woodbridge Irrigation District Dam (WIDD) used to determine total escapement and ad-clipped fish above WIDD. Natural spawner escapement estimate and ad-clip rate calculated by subtracting total count and number of ad-clipped fish returning to MOK. Supplemental carcass survey to collect bio-data from fresh fish and heads from all ad-clipped fish. Grilse cutoff: 700 mm. | EBMUD |
| Stanislaus River Fall | Superpopulation modification of the Cormack-Jolly-Seber mark-recapture estimate. All fresh fish examined for fin-clips, tags, marks. All fresh ad-clipped fish sampled and heads collected for CWT recovery. Opportunistic sampling of ad-clipped fish on Stanislaus Weir (i.e., "washbacks"). Grilse cutoff: 630 mm females, 740 mm males. | CDFW |
| Tuolumne River Fall | Superpopulation modification of the Cormack-Jolly-Seber mark-recapture estimate. All fish examined for fin-clips, tags, marks, and condition. All ad-clipped fish sampled and heads collected for CWT recovery. Grilse cutoff: 630 mm females, 740 mm males. | CDFW |
| Merced River Fall | Superpopulation modification of the Cormack-Jolly-Seber mark-recapture estimate. All fresh fish examined for fin-clips, tags, marks. All fresh ad-clipped fish sampled and heads collected for CWT recovery. Grilse cutoff: 630 mm females, 740 mm males. | CDFW |

^{a/} Biological sampling ("bio-samples" or "bio-data") of live fish or carcasses may include observed tags or marks, sex, fork length, scales, carcass condition, spawning condition, and heads collected from ad-clipped fish for CWT recovery.

Table 1c. Survey design and open dates for the 2017 CV Chinook river sport harvest.

| Sampling Location | Survey Design and Open Dates | Agency |
|---|--|--------|
| Sport Harvest | | |
| Survey Design | | |
| Central Valley Angler Survey (CVAS) | Stratified-random sampling design (one weekday and one weekend sample per week per section during the open season in each management zone) that included both roving counts and access interview components and sub-sampling of kept salmon. Almost all ad-clipped salmon sampled and heads collected for CWT recovery. Estimates of fishing effort, catch, and harvest of Chinook salmon made monthly for each survey section and then summed for the season total. | CDFW |
| Open Dates | | |
| Upper Sacramento River Fall and Late-Fall | Open Jul 16 - Dec 16 From the Lower Red Bluff Boat Ramp to Highway 113 bridge and Aug 1 - Dec 16 from the Deschutes Road Bridge to the Red Bluff Diversion Dam. Nov 1 is used to delineate the cutoff between the fall-run fishery and the late-fall-run fishery. Grilse cutoff: 650 mm fall, 600 mm late-fall. | |
| Feather River Fall | Open Jul 16 - Oct 15 from the unimproved boat ramp above the Thermalito Afterbay Outfall to 200 yards above the Live Oak boat ramp and Jul 16 - Dec 16 from 200 yards above the Live Oak boat ramp to the Sacramento River confluence. Grilse cutoff: 600 mm. | |
| American River Fall | Open Jul 16 - Dec 31 from Nimbus Dam to the Hazel Avenue Bridge, Jul 16 - Aug 15 from the Hazel Avenue Bridge to the USGS cable crossing, Jul 16 - Oct 31 from the USGS cable crossing to the SMUD power line crossing, Jul 16 - Dec 31 from the SMUD power line crossing to the Jibboom Street Bridge, and Jul 16 - Dec 16 from the Jibboom Street Bridge to the Sacramento River confluence. Grilse cutoff: 650 mm. | |
| Lower Sacramento River Fall | Open Jul 16 - Dec 16 from the Highway 113 bridge to the Carquinez Bridge. Grilse cutoff: 650 mm. | |
| Mokelumne River Fall | Open Jul 16 - Oct 15 from Camanche Dam to the Highway 99 Bridge, Jul 16 - Dec 31 from the Highway 99 Bridge to Woodbridge Dam, including Lodi Lake, and Jul 16 - Dec 16 from the Lower Sacramento Road bridge to the San Joaquin River confluence. Grilse cutoff: 675 mm. | |
| Bag and Size Limit | | |
| All Areas | 2 Chinook salmon per day; no minimum size limit. | |

Table 2. California ocean salmon sport and commercial fishery seasons by major port area, 2017.

| Major Port Area | Sport Fishery | | | Commercial Fishery | | |
|--|-------------------------|--------------------------|-----------|---|--------------------------|-----------|
| | Season | Size Limit ^{a/} | Days Open | Season | Size Limit ^{a/} | Days Open |
| Eureka/Crescent City (Klamath Mgmt Zone) | <i>Closed in 2017</i> | - | 0 | <i>Closed in 2017</i> | - | 0 |
| Fort Bragg | April 1 - May 31 | 20" TL | 61 | September 1-5, 8-12, 15-19, 22-26, 29-30 (3,000 fish quota ^{b/}) | 27" TL | 22 |
| | August 15 - November 12 | 20" TL | 90 | | | |
| San Francisco | April 1 - 30 | 24" TL | 30 | August 1 - 29 | 27" TL | 29 |
| | May 15 - October 31 | 20" TL | 170 | September 1 - 30 | 26" TL | 30 |

| Total Sport Harvest | | 41,571 | 2,559 | 684 | 644 | 629 | | | | |
| Total Sampled | | | 81,826 | 27,271 | 25,155 | 24,737 | | | | |

a/ Number of Chinook salmon sampled and visually checked for a clipped adipose fin or electronically scanned to check for the presence of a CWT.

b/ Nimbus Fish Hatchery opened three weeks early to collect anticipated stray fall-run from Coleman National Fish Hatchery (CFH). During those three weeks there were 2,886 fish collected.

c/ Prior versions of this report have evaluated the CFH late-fall-run trap separately, which consisted of late-fall-run that were trapped at CFH or observed via video weir after spawning operations had ceased. In 2017, only one fish was trapped after spawning had ended and none were observed on video, so the CFH late-fall-run trap and hatchery sectors were merged for this report.

d/ Late-fall-run hatchery returns and natural area escapement occurred during late fall of 2017 through early 2018 (return year 2018).

e/ Carcass survey sample expansion factor based on fresh fish only and expanded to all valid CWT recoveries if collected (see Appendix 1).

f/ Escapement estimate based on video counts; CWTs collected opportunistically in separate survey (e.g., kayak survey, snorkel survey).

g/ Battle Creek natural escapement estimated using Battle Creek video count minus fall return to CFH. Surrogate CWTs based on CFH hatchery proportion and CWT recoveries.

h/ Yuba and Mokelumne natural escapement CWTs collected on spawning grounds and expanded based on total ad-clip count observed via video weir (see appendices 4 and 5, respectively). For the Yuba River, 20 fish including 3 ad-clips observed below Daguerre Point Dam were added to the video count.

i/ Stanislaus natural escapement and sample expansion factor based on fresh fish only and expanded to all valid CWTs (29 CWTs recovered from washbacks on Stanislaus Weir; see Appendix 1).

a/ Natural creeks can include Clear Creek, Cow Creek, Cottonwood Creek, Paynes Creek, Mill Creek, Deer Creek, and Butte Creek, depending on survey year.

b/ Ocean recoveries of SacW are considered one year older than those of the same brood year recovered in the CV (i.e., brood year 2015 = age-3 in the ocean).

c/ Since MOKFx were raised at Merced Hatchery, recoveries in both the Mokelumne and Merced basins are considered in-basin.

Sacramento River fall Chinook release types (SFC)

CFHFh Coleman National Fish Hatchery fall hatchery releases
 CFHFh Coleman National Fish Hatchery fall delta/bay net pen releases
 FRHF Feather River Hatchery fall in-basin releases
 FRHFh Feather River Hatchery fall bay net pen releases
 FRHFnc Feather River Hatchery fall coastal net pen releases
 FRHFb Feather River Hatchery fall barge study releases
 FRHFk Feather River Hatchery fall experimental Knaggs Ranch releases
 NIMF Nimbus Fish Hatchery fall in-basin releases
 NIMFn Nimbus Fish Hatchery fall bay net pen releases

Other CV Chinook release types (OCV)

MOKF Mokelumne River Hatchery fall in-basin releases
 MOKFn Mokelumne River Hatchery fall delta/bay net pen releases
 MOKFnc Mokelumne River Hatchery fall coastal net pen releases
 MOKFb Mokelumne River Hatchery fall barge study releases
 MOKFx Mokelumne River Hatchery fall experimental releases (raised in Merced Hatchery)
 MERFn Merced River Hatchery fall delta/bay net pen releases
 MERFt Merced River Hatchery fall trucked releases (no net pens)
 SacW Livingston Stone National Fish Hatchery winter in-basin releases
 FRHS Feather River Hatchery spring in-basin releases
 FRHSn Feather River Hatchery spring bay net pen releases
 CFHLh Coleman National Fish Hatchery late-fall hatchery releases
 CFHLe Coleman National Fish Hatchery late-fall emergency trucked releases (no net pens)

a/ CFH and FRH releases recovered in the Upper Sacramento River and Yuba River, respectively, are considered stray recoveries in this table.

b/ Natural creeks can include Clear Creek, Cow Creek, Cottonwood Creek, Paynes Creek, Mill Creek, Deer Creek, and Butte Creek, depending on survey year.

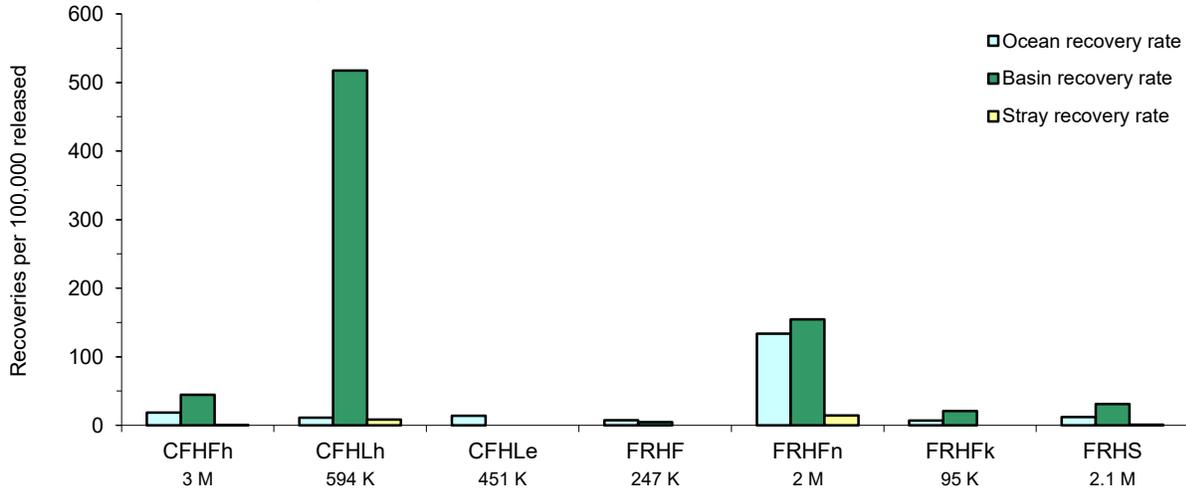

Sacramento River fall Chinook release types (SFC)

| | |
|--------|--|
| CFHFh | Coleman National Fish Hatchery fall hatchery releases |
| CFHFh | Coleman National Fish Hatchery fall net pen releases |
| FRHF | Feather River Hatchery fall in-basin releases |
| FRHFh | Feather River Hatchery fall bay net pen releases |
| FRHFnc | Feather River Hatchery fall coastal net pen releases |
| FRHFb | Feather River Hatchery fall barge study releases |
| FRHFk | Feather River Hatchery fall experimental Knaggs Ranch releases |

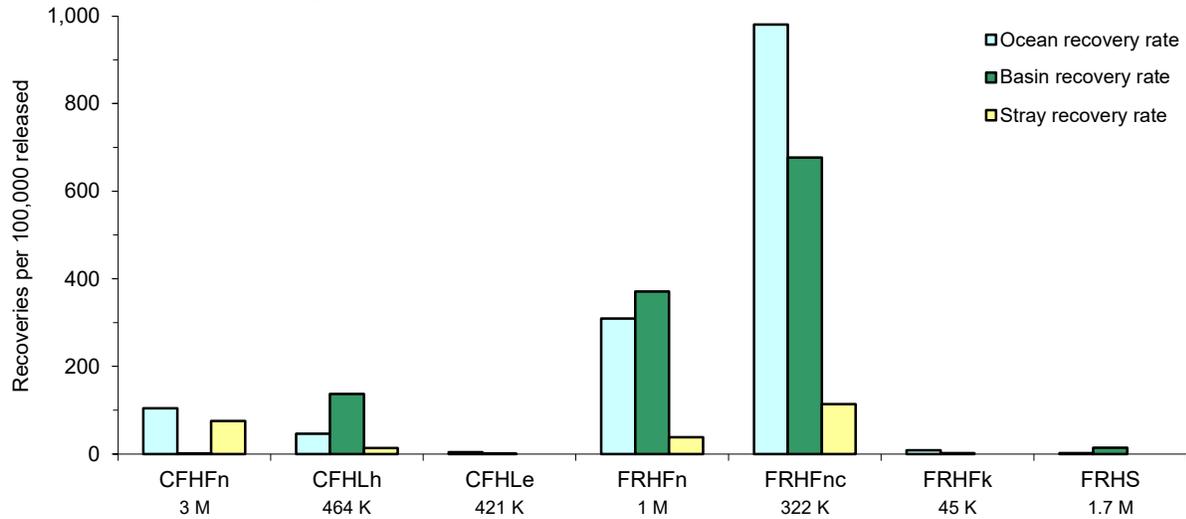

Other CV Chinook release types (OCV)

| | |
|-------|---|
| CFHLh | Coleman National Fish Hatchery late-fall hatchery releases |
| CFHLe | Coleman National Fish Hatchery late-fall emergency trucked releases (no net pens) |
| FRHS | Feather River Hatchery spring in-basin releases |
| FRHSn | Feather River Hatchery spring net pen releases |
